

KITCHEN CHAOS II

Teacher
Renan Grossi

In my kitchen, I **dive into** culinary experiments to **break away** from the screen of my IT life. I start by **pulling out** ingredients from the fridge, then I **chop up** some herbs, slice through peppers, and **dice up** garlic for a fragrant dish. I
5 **fire up** the stove, letting the pan **heat up** until it's sizzling hot.

I **throw in** the vegetables, letting them **cook down** until they're soft. Meanwhile, I **whip up** a marinade, brushing it onto some steaks that I've **taken out** to thaw. I **crank up**
10 the grill, and as the meat starts to **sizzle away**, I **clean up** the mess from my prep work, **wiping down** the counters and **scrubbing off** the stains.

With the meat **roasting away**, I **check back** on my laptop, where I've left a program running. I've set aside a
15 sous-vide machine nearby, **plugging in** a new recipe I've just **written up**. It's all about timing; I **pull out** the steaks just as they're done, letting them rest while I **log into** my system to **check out** the progress of my code.

The kitchen, now splattered with bits of food,
20 resembles the chaos of a coding marathon. I **stack up** the

dishes, **rinse** them **off**, and **load** them **into** the dishwasher, reflecting on how I've pieced together my latest software.

25 As everything **cools down**, I **sit back** with my meal, reflecting on how I've **mixed up** my day, blending the tactile joy of cooking with the abstract satisfaction of coding. Both require you to **break down** tasks, work through them methodically, and **end up** with something greater than the parts. Whether I'm **boiling over** with creativity or **simmering down** to the core of a problem, the kitchen serves as my
30 second lab, where I can **cook up** solutions or **code up** a storm.
