Renner: Financial Success in Retail Since 1962

Renner has been a leading retail company since 1962, selling clothes and home items. The company owns many assets, like stores and warehouses, which help make money. Every month, the team checks the balance sheet to see what Renner owns and what it owes as liabilities, like loans and supplier bills. The equity stays strong because assets are more than liabilities.

Now, Renner earns revenue and high turnover by selling fashion to customers. It spends expenses on fabrics, worker salaries, and store rent, tracked with its systems. The income statement shows if the company makes a profit or a loss. Last year, it paid a lot of tax to the government, but still made a good profit. The team monitors cash flow weekly and pays interest on loans to keep finances healthy.

In the past, Renner borrowed money to open new stores, adding debt. This investment increased sales and turnover, but the interest on the loan was high. The company paid some debt last quarter, improving its solvency. Accounts receivable grew when customers owed money for purchases. The team collected this cash and filed tax reports to maintain liquidity.

Today, Renner prepares a budget for next year using its data tools. It plans to reduce operating expenses and lower tax

35 costs by checking deductions. The gross margin will stay high if
turnover rises. The company expects to increase net income with
new online sales. In the future, Renner will invest in more stores,
which will improve efficiency and revenue. It is going to expand
its warehouses, adding to assets.

40

The statement of cash flows shows how cash moves in
the business. Last month, it received cash from sales and paid
expenses, tax, and interest. This liquidity keeps operations
running. Next year, the team will analyze the cost of goods sold
45 and interest rates to save money. Renner is going to hire more
workers, which will raise payroll but also turnover.

The company maintains a financial health report every
quarter. It shows return on assets, profitability, and tax payments.
50 Last year, the depreciation of old equipment reduced asset value,
but new technology will replace it. Renner plans to avoid credit
risk and high interest by checking customer payments. In the
future, it will build a strong financial strategy to grow turnover
and stay successful.
